

Welcome to the AI Bot Chess competition or ABC competition. Throughout this competition, you will create and compete with an algorithm that moves chess pieces based upon the opponent's actions. This is a friendly competition, and to keep it a healthy one, there are some basic house rules:

House Rules

1. You are encouraged to use AI to understand this code.
2. Do not modify the main.cpp file. Under no circumstances should you need to modify anything in that file except the statements to include the header files, but more on that in the instructions to begin.
3. You should never modify someone else's code files, only yours.
4. While I cannot prevent you from looking at someone else's code files, I can ask you not to copy someone else's code. Don't steal someone else's idea please.
5. Following up on Rule 4, the use of AI is not fully prohibited. If you would like to use AI to write your code, then you may request an admin to create a file for you which will be labeled AI_Coded alongside your name which will help other competitors differentiate your actual work from something that is AI generated. While you can code with AI, your own work will only be recognized and the final winner will only be chosen from competitors who did not use AI. You are welcome to have a file completely generated with AI, and another free of any AI.
6. AI is allowed to be used for compiling, but not recommended.
7. You are allowed to make your files to help the structure of your code, but if you do, make sure you label them properly with your name on it so other people don't use it.
8. Everyone may trash talk unless your name is Alex :)
9. Friendly discussion of ideas and helping debug each other's code is okay.
10. If you find a glitch in the code that you believe may affect the outcome of a match, then you must notify an admin about it. Taking advantage of a glitch to win a match is prohibited.
11. While the code is written to prevent illegal moves on the board, you personally cannot move the bot pieces illegally either. For example, the queen cannot jump two pawns and the entire board and eliminate the opposite king. That's not allowed. Make sure your bot follows chess rules.
12. If you would like to see anything added or changed to the code, please let an admin know.
13. Additional rules may be added with a majority vote from the competitors.

Instructions

Go ahead and download the Github repository files provided. When you are done making any changes to the code, please sync the repository again with the main repository so that others can play with your bot. This is created such that other competitors can put their bots head to head with one another's blah blah blah... ok stop reading this, I don't feel like typing this

anymore. Its already a two page document. Read the README.md file and it will have everything you need. I will probably polish this document later if I feel like it, but recommend you first just download and run the program as it is.
